

2016 - 2017 Influenza Season Year End Report

The Health Department is concluding its annual influenza surveillance for Winnebago County and would like to provide a year end report that indicates what the community experienced during the season.

We, the Health Department extend our gratitude to our Community Partners that provided the weekly collection of data from hospitals, physicians and laboratories. Without this effort, the Health Department would be unable to provide this important information to the community.

The top figure on this page represent the total number of positive influenza tests reported to the Health Department during the 2016-2017 season. Influenza A accounted for 63% of the positive tests during the season.

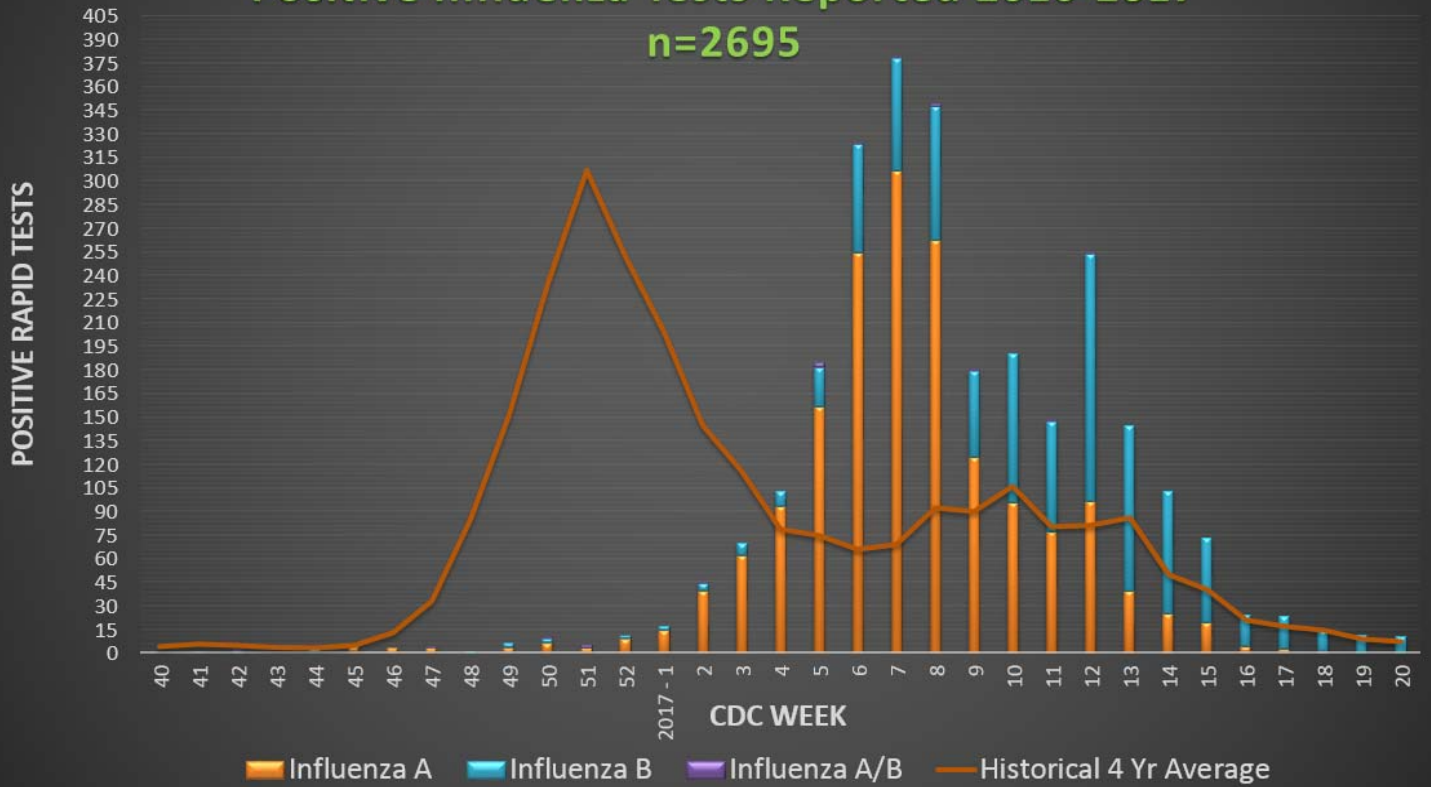

In comparison, the bottom figure displays the total number of positive influenza tests reported during the 2015-2016 season. Influenza A accounted for 72% of the positive tests during the season.

The figures on page 2 represent the epidemiology curves for the 2016-2017 and 2015-2016 influenza seasons.
